

- B1
Cath*
26. (New) The method of claim 25 wherein the body fluids are extracted external to the body and wherein analyzing the body fluids occurs external to the body.
27. (New) The method of claim 25, wherein the aspiration catheter is passed through a self-closing diaphragm located within the port body.
28. (New) The method of claim 23, further comprising introducing a medicament through a second tube coupled with the port body.
29. (New) The method of claim 27, wherein the medicament is introduced through a feed catheter inserted through the second tube.
30. (New) The method of claim 29, wherein the feed catheter is passed through a self-closing diaphragm located within the port body.
31. (New) The method of claim 23, further comprising inserting a probe through the first tube to contact the body fluid.
32. (New) The method of claim 31, wherein the probe is a test strip.
33. (New) The method of claim 31, wherein the probe detects the concentration and/or existence of a substance.
34. (New) The method of claim 31, wherein the probe is a microdialysis probe.
35. (New) The method of claim 23, wherein a testing device is permanently mounted within the implantable device.
36. (New) The method of claim 35, wherein the testing device is located within the first tube.

37. (New) The method of claim 35, wherein the testing device includes an electronic test sensor.
38. (New) The method of claim 37, wherein the electronic test sensor includes one or more connecting wires passing through the port body, external to the body.
39. (New) The method of claim 38, wherein the connecting wires are coupled with a working electrode, a counter-electrode and a zero current electrode.
40. (New) A method of testing body fluids and introducing a medicament comprising:
implanting a port body into a body, the port body having a selectively accessible exposed portion external to the body, an aspiration tube depending from the port body and in contact with a source of body fluids, and a feed tube depending from the port body;
passing a medicament through the selectively accessible exposed portion and into the feed tube, wherein the medicament is introduced to the body upon exiting the feed tube; and
aspirating body fluids in the aspiration tube wherein the body fluids are tested to determine presence and/or concentration of an element within the body fluid.
41. (New) The method of claim 40, wherein the selectively accessible exposed portion is a self closing diaphragm.
42. (New) The method of claim 40, wherein passing a medicament further comprises introducing a feed catheter through the selectively accessible exposed portion .
43. (New) The method of claim 40, wherein aspirating body fluids further comprises introducing an aspirating catheter through the selectively accessible exposed portion and passing the aspirating catheter through the aspirating tube until the aspirating catheter contacts body fluids.
